

USER FLOWS & TECHNICAL ARCHITECTURE

Femi9 — how it works, visualized

The subscription model end-to-end (where it goes, how admin sees it, how it ships, what it costs), the core customer flows as diagrams, and the technical architecture that runs it all.

1 The subscription model — where does it go?

When Tavia chooses **Subscribe & Save** on a product, this is the exact path her subscription takes and everyone who can see it.

Q	Answer
Where does it go?	Into the <code>Subscription</code> table in Postgres — tied to the customer, the exact product variant, quantity, chosen cadence, and a <code>nextDeliveryAt</code> date. Nothing is on the device; it lives on the server.
How does the admin see it?	In the Ops console at <code>/admin/subscriptions</code> — a table of every active plan with the customer, product, cadence, next delivery date, and status. (Aravind can also see the renewal orders it generates in <code>/admin/orders</code> .)

2 How it renews & ships — the recurring loop

A subscription is a promise to reorder on time. This loop keeps that promise automatically.

How you ship it (today): a renewal (or any) order lands in `/admin/orders` as `pending` → `paid`; Aravind (or the fulfilment team) packs it and advances it `processing` → `shipped` → `delivered`. **Next upgrade:** plug a courier/AWB integration (Delhivery/Shippo) so tracking numbers and labels are automatic — the status pipeline is already there to hang it on.

3 What does the subscription cost?

Subscribe & Save is a straight **15% off** the one-time price, charged every cadence. The 15% is an editable setting in admin — change it once, and every product follows.

Worked examples (current catalogue)

Product	Pack	One-time	Subscribe (–15%)	She saves / cycle
330mm Double Wings	9 pads	₹225	₹191	₹34
330mm Double Wings	6 pads	₹149	₹127	₹22
290mm Large	9 pads	₹198	₹168	₹30
330mm Centre Wings	9 pads	₹225	₹191	₹34
Period Panties	size	₹649	₹552	₹97

Cadence options	Every cycle (~before her period) · Every 4 weeks · Every 6 weeks — she picks; it sets the next-delivery date.
Shipping	Free over ₹999, else ₹49 (an editable setting). Applied to each recurring order the same as a one-time order.
Commitment	None — pause, skip, change, or cancel anytime from her account. "Saved so far" accrues across her deliveries.

4 The one-time purchase flow (for comparison)

5 Technical architecture — the system

The production stack (AWS, Mumbai) that serves the storefront and admin, takes payments, and runs the subscription cron.

6 The data model — how it all connects

The core entities behind the flows above. A subscription and an order both point at a product **variant**; both belong to a **customer**.

The through-line: whether Tavia buys once or subscribes, it resolves to the same objects — a **customer**, an **order** against a **variant**, a **payment**, and **points**. Subscriptions just add an automated, discounted, recurring source of those orders. That's why the admin sees everything in one place.
